Identity-as-a-Service (IDaaS)

Enabling Trusted Connectivity – Flexibly and Efficiently

Consumerization of IT and trends around social, big data and cloud have made effective Identity and Access Management (IAM) a business imperative for the modern enterprise. For example, IAM enables:

- Improved **security** and reduced business risk, by exploiting latest approaches such as password less authentication, conditional access and securing of APIs

- Improved **collaboration** across the extended enterprise - employees, contractors and business partners

- Improved **user experience**, simplifying and enabling user access to services anytime, anywhere via any device

However, moving forward with modern IAM across the enterprise and beyond is complex with business as well as technology challenges to overcome, and this is where Capgemini can help.

Introducing Capgemini Identity-as-a-Service (IDaaS)

Capgemini IDaaS is our pre-packaged, optimized IAM Managed Services solution for flexible, rapid and cost-effective delivery. It gives you the full functionality and flexibility of market leading IAM products deployed to meet your specific IAM requirements, across the '3 pillars of Identity':

- **Identity Governance and Administration (IGA)** enables identities and entitlements to be managed and governed across all systems within the extended enterprise.

- **Access Management (AM)** provides risk-based contextual access controls to simplify user experience across all channels, irrespective of device or network, whilst providing intelligent threat analytics and monitoring.

- **Privileged Access Management (PAM)** provides control of privileged accounts and privileged usage across the entire PAM operational lifecycle from discovery to control, monitor, response and audit.

These services are provided in a rapidly deployed, pre-packaged, modular, managed and hosted form on a subscription basis and are fully integrated with our broader Managed Security Services. The Capgemini IDaaS Framework gives us the ability to manage and provide all the elements of an evolving IAM platform service, integrated within a client's environment including legacy IAM, and then use that to provide business value through IAM. Capgemini becomes your 'IAM partner of choice', to achieve higher levels of integrated IAM to truly enable your business.

What makes Capgemini IDaaS unique?

In many ways, Capgemini IDaaS redefines IDaaS. Traditional IDaaS focuses on providing repeatable hosted IAM platform services, reducing price through limiting functionality over on-premises IAM. In contrast, Capgemini IDaaS provides an evolving framework of IAM services, processes and controls working as part of a broader identity ecosystem. Capgemini IDaaS comprises of pre-packaged hosted IAM platform services based on full-functionality IAM products from market-leading vendors. We then augment these core IAM application and platform services by additional service layers that enable clients to take a more holistic approach to IAM and rapidly gain business value from these investments, namely:

- **IDaaS Consulting Layer:** Understanding, identifying, planning and justifying how to proceed with IAM and IDaaS in your organisation, through a unique fact-based benefits-led approach: IAM FastTrack.
- **IDaaS Business Layer:** The optimized provision of IAM Professional Services effort to derive business value from core IAM services, meeting common use cases through predefined policies, processes, workflows, application integrations, patterns, accelerators, etc.
- **IDaaS Service Layer:** Exploiting our Global Security Operations Centres, providing 24x7 operations and service management across all aspects of IAM. Enabling higher and more efficient levels of IAM operations, reporting and co-ordinated incident management.

Capgemini IDaaS benefits

With our Identity-as-a-Service solution, clients enjoy benefits such as:

- Flexibility and customizable functionality of market leading IAM products, working together as part of an evolving IAM Framework
- Fast Deployment with services hosted on **Capgemini Cloud Platform (CCP)**
- Pre-configured use cases and reporting out of the box
- Fully integrated IAM platform services across Identity Governance and Administration (IGA), Privileged Access Management (PAM) and Access Management (AM) modules, integrated with our other Cybersecurity and Cloud enablement services, extendable within a broader Identity ecosystem.
- Modular, subscription-based pricing with no up-front investments and charges per-user-per-month. Significantly reduced Total Cost of Ownership compared to customer self-build IAM (up to 90%) and up to 25% less than other popular IDaaS providers.

With over 500 SMEs, Capgemini has one of the world's largest IAM practices, providing IAM services to more than 160 customers across multiple sectors over many years. Connect with us to understand more.
