Discover how data-centric innovation *makes it real.*

Embracing cloud transformation drives data-centric innovation, increases business agility, supercharges growth, and makes companies more sustainable. At the same time, artificial intelligence and cutting-edge technologies are driving a new age of insights. Companies need to embrace a collaborative, people-centric approach to succeed in a rapidly evolving landscape.

Capgemini has worked with Google Cloud around the globe to put intelligence at the core of our clients’ businesses. We share a passion and genius for data and AI innovation that unleashes the full potential of intelligence at scale. We understand that true data mastery in the cloud opens a world of endless possibilities and ignites human-AI chemistry.

Mastering multiple data layers and modernizing infrastructure builds the foundation to scale for future growth. Combining the experience of Capgemini and Google Cloud, our clients unlock answers and start focusing on limitless possibilities, thanks to new insights into their data.

In this lookbook, explore how we help free our clients from legacy systems to find new sources of long-term value. Google Cloud opens the door to more innovation so companies can fulfil the potential of AI, technology, and people. Ask how Capgemini and Google Cloud can make your cloud strategy real.

Improving river health in the United Kingdom

Additive Catchments is a mission-led, majority non-profit-owned company focused on restoring trust in environmental systems through independent, data-driven insight.

Read more

Its CMaaS (Catchment Monitoring as a Service) platform monitors water quality and provides insights that can help unlock cleaner water, healthier ecosystems, and faster, more confident compliance with environmental regulations. Leveraging Google Cloud technologies, CMaaS delivers instant, high-integrity insights across river basins.

To enable delivery at scale, Additive Catchments chose Capgemini as its lead implementation and cloud integration partner. Capgemini brings a proven track record in

environmental data engineering, digital governance, and AI-led transformation. Its role ensures that CMaaS can be deployed reliably and effectively across diverse catchments, combining technical strength with delivery excellence.

The project demonstrates how civic ventures, hyperscalers, and integrators can co-design systems that foster public confidence, regulatory alignment, and collective action.

“This alliance ensures clients have access to consistent, secure, and credible data services, driving a new standard of innovation in environmental decision-making. This is not just a UK solution, it’s a globally exportable model for digital catchment management.”

Using AI to enhance industrial workflows

With a focus on hydraulics and automation, Bosch Rexroth offers cutting-edge automation solutions, software, and services to help make businesses more efficient, powerful, digital, and sustainable.

Working with Capgemini, Bosch Rexroth continues to transform the shopfloor with innovation. The company’s asset orchestration platform (AOP) is consolidating assets that are now AI-powered to provide speed, efficiency, flexibility, and improved user experience.

Asset orchestration triggers machine functions, gathers data, processes it, and sends it where it is needed at the right time. Leveraging Gemini 2.0, workflows are described in a user-friendly way or altered with a simple user prompt. Or they can be used to create a first workflow draft in the AOP workflow UI, saving time and money during the design phase.

Bosch Rexroth made the orchestration of machine control in its factories significantly more precise and repeatable, with a 20 percent reduction in error rate in script execution.

With the support of Google AI, Bosch is able to accelerate process designs by a factor of two while ensuring error-free process flow. By mirroring the machine process flows in the user’s cockpit, it is now possible for the first time to understand what can be optimized in machine process control. This is a completely new view into the shopfloor.

This infusion of AI is revolutionizing the shopfloor experience to help Bosch Rexroth stay ahead of tomorrow’s manufacturing challenges.

“With Capgemini’s vision of a software-defined factory (SDF), we are tackling today’s challenges on shopfloors in an innovative and transformative way.”

Making tools more intelligent on the shopfloor

Bosch Software and Digital Solutions (Bosch SDS) is a global digitalization provider of consulting, engineering, and IT services. It helps enterprises Switch to Smarter Digital, a forward-looking approach to digitalization.

Working with Capgemini, the company created an intelligent screwdriver for Bosch Rexroth as a use case for generative AI. The screwdriver connects to Bosch SDS' IoT suite of proprietary software tools, so it fits seamlessly into the manufacturing process.

The screwdriver is used to complete a pre-defined task and has specific directions, such as the correct tightening angle and force that needs to be applied to ensure a screw is installed properly.

The data from the screwdriver is then sent to Google Cloud via the IoT Suite for analysis. **Using generative AI via Gemini, the data is dynamically displayed so it can be analyzed, providing the shopfloor with real-time information on the performance of the screwdriver and on any adjustments that are required.**

The success of this human-machine interface use case means Bosch SDS can apply this kind of connection to more tools on the shopfloor.

Enhancing BDUK’s data capabilities

Building Digital UK (BDUK) is a government agency focused on improving digital connectivity across the UK to transform lives and drive economic growth. Project Gigabit is the government’s program to enable hard-to-reach communities with access to gigabit-capable broadband.

Capgemini was engaged to speed up the implementation of robust data management systems, which are critical to the efficient delivery of essential data to support the delivery of Project Gigabit.

Capgemini developed several solutions in Google Cloud, including a well-defined data architecture; repeatable, scalable data pipelines; a comprehensive data observability suite; and consolidated reporting services.

Read more

Automating the data integration and transformation process has helped reduce manual effort and potential errors, freeing up resources for more strategic tasks. A well-defined data architecture also helps ensure compliance with data privacy regulations and enhance the overall data posture now and into the future.

“Together, BDUK and Capgemini have utilized the capability and capacity of the private sector to enhance the resilience, reliability, and pace of BDUK data outputs and outcomes – supporting the delivery of the government’s Project Gigabit objectives.”

Bringing BK Buddy to life

Equipment failures in a Burger King restaurant can have major impacts on guest experience and revenue. Local managers usually found themselves trying to fix issues until an engineer arrived.

Burger King, Capgemini, and Google Cloud co-developed BK Buddy, a growing suite of AI-powered tools designed with and for restaurant managers. The goal is to turn AI into a daily operational advantage.

BK Buddy: Maintenance is the first live tool in the suite and provides managers instant answers and step-by-step support when equipment goes down.

Engineer callouts are down 15 percent, with managers fixing issues faster, reducing costly downtime. Plus they are training new staff quicker and more confidently on the job.

It is a human-centric approach grounded in the real-world and designed to scale. With managers helping to shape every step, BK Buddy is simple, store-specific, and built for the pace of a real shift, so managers can focus on delivering a great guest experience.

“BK Buddy makes my life easier, which means I have more time for my customers.”

Delivers a *modern digital journey*

To maintain its competitive position in the Malaysian market, Celcom wanted to revitalize its customer journey with a new set of digital tools and streamline ways of working from inside and out.

Working with Capgemini, Celcom implemented new front-end channels, platforms, and processes to create a new digital journey for its customers. The transformation also introduced a culture shift for new, flexible ways of working with tools for the employees to operate more effectively.

With more agile tools, Celcom developed new front-end channels for its stores and digital tools for customer engagement.

Developed on Drupal and hosted on Google Cloud, Celcom's web portal is now the number one most visited telco website in the country, with substantial growth in awareness and engagement. The company experienced a 91% increase in e-store activations in one year and online revenues increased more than 60%.

Read more

The results delivered:

- 1.6 million new unique users for Celcom's mobile applications
- 91% increase in e-store activations in less than one year
- 13% increase to its NPS satisfaction score
- Increase in online revenues of over 60%
- 25% increase in operational efficiency by eliminating duplicated efforts
- 45% year-on-year increase in story points delivered since the beginning of its cultural transformation journey
- Expected savings of approximately RM27 million over next 5 years

AI-driven approach to demand forecasting with Google Cloud

Danfoss is a Danish multinational company that engineers and manufactures energy-efficient solutions that increase machine productivity, reduce emissions, lower energy consumption, and enable electrification.

[Read more](#)

AI and sustainability are transforming the way Danfoss does business, with a focus on driving productivity and future growth, and creating long-term sustainable value.

The company needed to improve the accuracy of existing demand forecasting to better manage inventory and enhance customer service. **Leveraging BigQuery and Vertex AI, it leveraged AI to increase the accuracy of the existing demand forecasts.** It also rapidly established and tested a platform sandbox that supports this AI application and allows for future scaling.

The result is a more accurate forecast, optimal inventory levels, improved cash flow, cost reductions, enhanced supply chain quality, and happier customers. Now Danfoss is expanding its demand forecast use case to more product lines.

“Introducing an AI-driven approach and improved forecast accuracy across business lines of between 10 and 35 percent.”

Digitizing history to shape the future with the Imperial War Museum

The Imperial War Museum (IWM) in London needed to transcribe and make more accessible 20,000-plus hours of historic oral history interviews held on audio files.

This included roughly 8,000 interviews with service men and women and civilians, conducted between 1945 and the early 2000s. This presented unique challenges, including regional accents, specialized military terminology, and varying audio quality.

Capgemini and Google Cloud used Vertex AI to translate, transcribe, and make the recordings more searchable so users could easily access, search, and discover these archives using AI language tools.

[Read more](#)

The finished application allows users to search via transcriptions and metadata, listen to recordings while viewing synchronized transcripts, and access AI-generated insights about the languages covered, length of recordings, and subject matter – all in one easy-to-use interface. Plus, the innovative “Ask a question” functionality allows the use of natural language for questions about any interview and receive answers drawn directly from the content, providing a conversational experience.

“Through this incredible partnership, we’ve made thousands of hours of oral histories far more accessible and searchable. By harnessing artificial intelligence, we are enabling researchers and the public to connect with these personal perspectives on conflict in ways never before possible. This work goes beyond transcription, enabling new forms of digital discovery. This partnership between Imperial War Museums, Google, and Capgemini is the first use of such advanced AI technology in the museums sector. It will be foundational in changing how we can all access and learn from our shared past.”

Calculating the cost of connectivity

Nokia is a multinational telecommunications, IT, and consumer electronics corporation committed to reaching net zero by 2040.

Being connected is essential for users, but device connectivity accounts for a significant share of communications networks’ total energy consumption and Scope 3 emissions.

Read more

Working with Capgemini and Google Cloud, Nokia created the MyEnergy app pilot to inform, nudge, and empower users to reduce their energy and data footprints. Personalized recommendations help shift mobile user behavior to be more sustainable. Little changes add up when the solution is scaled and can make a measurable decrease in Scope 3 emissions.

The company worked to build trust with customers with the right user experience: the network can spot subtle patterns and nudge users at scale, based on detailed behavioral data. Now subscribers can be part of energy savings goals, with a Scope 3 score that serves as a tangible metric they can understand.

Initial pilots have demonstrated encouraging results, with strong user engagement and early indicators of behavior change translating into meaningful emissions impact.

Looking forward, the roadmap includes new features such as carbon-saving leaderboards, AI-powered personalization, and integration with carbon offset platforms.

“Even small changes such as shifting just 10 percent of video streaming to Wi-Fi can create substantial downstream benefits at scale.”

Establishing a hybrid cloud for a public-sector platform

A public-sector client needed to accelerate time-to-market for its services and move to a hybrid cloud environment.

Following an assessment by Capgemini, the administration chose Google Cloud with sovereign controls to manage and store its highly sensitive, controlled, and classified information on servers within the country’s borders.

The result is a secure hybrid cloud environment that adheres to special government requirements around security and privacy. The ministry also has the agility to scale Google Cloud as needed and accelerate digital projects while adhering to legal and compliance requirements.

Generative AI delivers better supply chain management for global conglomerate

A global conglomerate with many lines of business needed to drive efficiency in its supply chain and warehouses. Even small changes in demand or inventory levels lead to significant costs.

Working with Capgemini and Google Cloud, the company used a data-driven stock quantity-centered approach to better understand the market and consumer demand.

Now the company has two elements working to prevent value loss in warehouses:

- A generative AI-based chatbot built on Google Vertex AI that generates database queries on the fly and interactively provides answers in text, diagrams, graphics, tables, and figures
- A forecast engine generating reports based on historical data so the company can now be proactive in responding to market conditions.

Shortening the period between analytical requests and responses gives the company improved real-time insights into the market and a better picture of current demand to avoid loss of stock value and determines how to get the most value out of the remaining stock.

Powered by Google Cloud, the solution solves inventory and warehouse issues for:

- Greater efficiency within warehouse logistics
- Costs savings by minimizing storage costs
- Maximizing profit-margins by optimizing stock levels.

About Capgemini

Capgemini is an AI-powered global business and technology transformation partner, delivering tangible business value. We imagine the future of organisations and make it real with AI, technology and people. With our strong heritage of nearly 60 years, we are a responsible and diverse group of 420,000 team members in more than 50 countries. We deliver end-to-end services and solutions with our deep industry expertise and strong partner ecosystem, leveraging our capabilities across strategy, technology, design, engineering and business operations. The Group reported 2024 global revenues of €22.1 billion.
