Organizations Deploying Artificial Intelligence Are Creating Jobs and Increasing Sales

New research from Capgemini's Digital Transformation Institute shows that four out of five companies implementing AI have created new jobs as a result of AI technology

Paris, September 7, 2017 – [Capgemini](#), a global leader in consulting, technology and outsourcing services, has today announced the findings of “[Turning AI into concrete value: the successful implementers' toolkit](#)”, a study of nearly 1,000 organizations with revenues of more than \$500m that are implementing artificial intelligence (AI), either as a pilot or at scale¹. The research both counters fears that AI will cause massive job losses in the short term, as 83% of firms surveyed say AI has generated new roles in their organizations, and highlights the growth opportunity presented by AI: three-quarters of firms have seen a 10% uplift in sales, directly tied to AI implementation.

Job creation

The report, which surveyed executives from nine countries and across seven sectors, found that four out of five companies (83%) have created new jobs as a result of AI technology. Specifically, organizations are producing jobs at a senior level, with two in three jobs being created at the grade of a manager or above. Furthermore, among organizations that have implemented AI at scale, more than 3 in 5 (63%) said that AI has not destroyed any jobs in their organization.

Alongside the trend towards job creation at management level, the report provides further evidence that organizations see AI as a means of reducing the time employees spend on routine and administrative tasks to enable them to deliver more value. The majority of respondent organizations (71%) have proactively initiated up-skilling/re-skilling of employees to take advantage of their AI investments. For those who have implemented AI at scale, the vast majority believe that AI will make complex jobs easier (89%) and that intelligent machines will coexist with humans within their businesses (88%).

“What we really want to do is to use humans to the best of their capabilities,” said Michael Natusch, Global Head of AI at Prudential. *“AI is taking away the time humans previously spent on repetitive issues and allowing them to focus on where human intelligence can drive value – for both themselves and for customers.”*

AI adopters focused on the customer experience

The study found that tech-savvy businesses are using AI to increase sales, boost operations, facilitate customer engagement and generate business insights; it is working, as three-quarters of firms are already seeing a 10%

¹ 'Implementing at scale', refers to implementations that go beyond small pilot and test projects and are adopted at a larger scale in an organization across business units, functions or geographies.

uplift in sales since starting to use the technology. The customer experience is a big focus of AI adopters: 73% think AI can increase customer satisfaction scores and 65% believe it could reduce future customer churn.

Missed opportunities

However, the research indicates that many organizations have yet to align their AI investments with business opportunities. In the hands of the technologists, businesses are prioritizing challenging AI projects and missing lower hanging fruit. More than half (58%) are focused on “need to do” implementations, or those that are high complexity/high benefit projects like customer service issues, while only 46% are deploying “must do” AI implementations with low complexity/high benefit. If firms tackled both problems simultaneously, they could see higher business benefits. For instance, those implementing a large number of “must do” use cases are able to reduce churn by up to 26% on average.

Traditional sectors leading the charge

Established and highly-regulated sectors are leading on AI innovation: 49% of telcos, 41% of retailers and 36% of banking institutions have seen the highest implementation of AI at scale, however, automotive (26%) and manufacturing (20%) industries are those currently with the lowest levels of utilization among companies implementing AI.

There is also a stark contrast across regions, as well as sectors. Among AI implementers, more than half (58%) of Indian companies are already using AI at scale, with Australia (49%) closely behind. European countries, including Spain (31%), the Netherlands (24%) and France (21%) are further down the list of those using AI technologies, indicating firms in these markets are not yet ready to adopt the technology.

Ron Tolido, Chief Technology Officer for the Insights & Data Practice at Capgemini, said, *“AI has the capacity to revolutionize every business in every market sector; its potential is broad and unlimited. However, we are seeing a large contrast between those who are rolling out applied AI solutions at scale and reaping tangible business benefits, versus those who are simply trialing the technology.”*

It’s also quite revealing that organizations are focusing more of their efforts on the more complex AI projects and missing out on simpler projects that could drive quicker returns. Organizations, especially those not yet implementing AI at scale, should focus on those low-complexity, high benefit projects to quickly and better leverage the power of AI.”

Getting started with AI

As organizations look to harness the power of AI, they will face a range of challenges, and will need to have a clear view of where AI can create the most enduring advantage for themselves and their customers. The report concludes by setting out key steps to get started in implementing AI, including:

- Manage the key technology and people challenges
- Pinpoint where AI can create the most significant, long-term advantage
- Combine top-down vision with bottom-up execution
- Prepare the organization.

Research methodology

Capgemini's Digital Transformation Institute research provides insights on the opportunities and benefits of artificial intelligence for organizations. The report covers the views of 993 respondents from nine countries: Australia, France, Germany, India, Italy, Netherlands, Spain, UK and US. Participants included AI-focused executives (senior managers and above) at global companies, startups and vendors across seven industry sectors: automotive, banking, insurance, manufacturing, retail telecommunications and utilities. The surveyed companies had revenues of \$500 million and above each. The research was conducted between March and June 2017.

About Capgemini

With more than 190,000 people, Capgemini is present in over 40 countries and celebrates its 50th Anniversary year in 2017. A global leader in consulting, technology and outsourcing services, the Group reported 2016 global revenues of EUR 12.5 billion. Together with its clients, Capgemini creates and delivers business, technology and digital solutions that fit their needs, enabling them to achieve innovation and competitiveness. A deeply multicultural organization, Capgemini has developed its own way of working, [the Collaborative Business Experience™](#), and draws on [Rightshore®](#), its worldwide delivery model.
